Homework Assignment #5

due in class Friday, October 7

Cover sheet: Staple this page in front of your solutions.

Write the *answers* (without calculations) on this page; write the detailed *solutions* on your own paper.

[21] Problem 3.4.**

Answer: Suppose M_{Cart} = 3 m_{hobo} . Then the ratio $v_{final}(b)/v_{final}(a)$ is ... (M_c + 1.5 m_h) / (M_c + m_h) = 9 /8

[22] Problem 3.5.** (There is no answer to report here.)

[23] Problem 3.6.* Answer: the thrust, in tons, is 4170

[24] Problem 3.10.* Answer: the mass when p is maximum is ... $0.368 m_0$

[25] Problem 3.12.**

Answer: the final speed for the two-stage rocket is ...

 $1.050 v_{ex}$

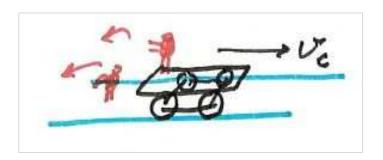

[26] Problem 3.13.** The height at t = 120 s is ... 39.9 km

<u>5.1</u>

Homework Assignment #5

Problem 3.4

Two hobos on a hand cart ...

(a) If they jump simultaneously then

momentum is conserved \Rightarrow $M_c v_c + 2m_h (v_c - u) = 0$

thus

$$V_{c} = \frac{2m_{h}u}{M_{c} + 2m_{h}} = \frac{m_{h}u}{M_{c} + 2m_{h}} [2]$$

(b) If they jump one after the other then

1. first jump
$$\Rightarrow$$
 $(M_c + m_h) v_1 + m_h (v_1 - u) = 0$

2. second jump
$$\Rightarrow$$
 $M_c v_2 + m_h (v_2 - u) = (M_c + m_h) v_1$

These are two equations for two unknowns (v_1 and v_2).

We want the final speed of the car = v_2 .

After a bit of algebra, the answer is

$$U_2 = \frac{m_h u}{M_c + 2m_h} \left[\frac{2M_c + 3m_h}{M_c + m_h} \right]$$

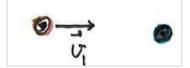

The second procedure gives greater speed to the car.

Problem 3.5

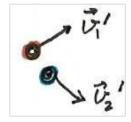

An elastic collision with equal masses ...

Equal masses, and one particle is initially at rest.

Before the collision:

After the collision:

Conservation laws

Momentum $m \mathbf{v}_1 = m \mathbf{v}_1' + m \mathbf{v}_2' \Rightarrow \mathbf{v}_1 = \mathbf{v}_1' + \mathbf{v}_2'$ (1)

Kinetic energy $\frac{1}{2}$ m $v_1^2 = \frac{1}{2}$ m $v_1^{'2} + \frac{1}{2}$ m $v_2^{'2}$

 \Rightarrow $v_1^2 = v_1'^2 + v_2'^2$ (2)

By eq. (1)

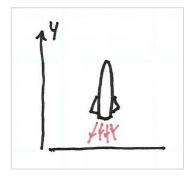

$$v_1^2 = (v_1' + v_2')^2 = v_1'^2 + v_2'^2 + 2 v_1' \cdot v_2'$$

Comparison to eq. (2) implies $\mathbf{v_1'} \cdot \mathbf{v_2'} = 0$.

That is, the final velocities must be perpendicular.

Problem 3.6

The Saturn V rocket ...

The rocket equations are

$$dm/dt = -K$$

$$dm/dt = -K$$
 and $v = v_{ex} \ln (m_0/m)$.

We have these parameters:

$$K = 15 \times 10^3 \text{ kg/s};$$
 $v_{ex} = 2500 \text{ m/s}$

$$v_{ex} = 2500 \text{ m/s}$$

The calculation :::

Thrust =
$$m \, dv/dt = K v_{ex} = 37.5 \times 10^6 \, N$$
 $x(1 \, ton / 9 \times 10^3 \, N)$

= 4170 tons of force.

Compare that to the initial weight = 3000 tons.

*5.*4

Problem 3.10

A rocket in deep space ...

A rocket accelerates from rest in deep space.

Calculate the *maximum momentum* of the rocket.

The rocket equation (there is no external force) is

$$v(t) = v_{ex} \ln [m_0 / m(t)].$$

The momentum at time t is p(t) = m(t) v(t), so

$$p = m v_{ex} ln [m_0/m].$$

To find the maximum momentum, set dp/dm = 0.

$$\frac{dp}{dm} = v_{ex} ln(\frac{mo}{m}) - v_{ex}$$

Therefore dp/dm = 0 implies

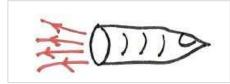

$$ln\left(\frac{m}{m}\right) = 1$$

That is,
$$m = m_0 / e = 0.368 m_0$$
.

The maximum momentum is

$$p_{max} = (m_0/e) v_{ex} ln[m_0/(m_0/e)]$$

= $m_0 v_{ex} /e$
= $0.368 m_0 v_{ex}$.

Problem 3.12

A two - stage rocket ...

(a) First, consider a single-stage rocket;

$$v_{\text{final}} = v_{\text{ex}} \ln (m_0 / m_{\text{final}}) = v_{\text{ex}} \ln [m_0 / (0.4 m_0)]$$

= $v_{\text{ex}} \ln (5/2)$ = 0.916 v_{ex}

- (b) Now, two stages;
 - 1. the first stage $(m_0 \rightarrow m_1 = 0.7 \text{ m}_0)$ $v_1 = v_{ex} \ln (m_0/m_1) = v_{ex} \ln [m_0/(0.7 \text{ m}_0)] = v_{ex} \ln (10/7)$
- 2. the second stage $(m_1' \rightarrow m_2 = 0.3 m_0)$ [where $m_1' = m_1 0.1 m_0$] $v_2 = v_1 + v_{ex} \ln \left[(m_1 0.1 m_0) / (m_1 0.1 m_0 0.3 m_0) \right]$ $= v_{ex} \left\{ \ln(10/7) + \ln(6/3) \right\} = v_{ex} \ln (20/7) = 1.050 v_{ex}$
- The two-stage rocket reaches a larger final speed.

5.6

Problem 3.13

A rocket taking off in Earth's gravity ...

The velocity of a rocket accelerating upward

in Earth's gravity (near the Earth's surface and starting from rest) is

$$v(t) = v_{ex} \ln [m_0 / (m_0 - K t)] - g t.$$

The height at time t is

$$y(t) = \int_0^t v(t') dt' = \int_0^t \{v_{ex} \ln(m_0) - \ln(m_0 - Kt') - gt'\} dt'$$

$$y(t) = \int_{0}^{t} v(t') dt'$$

$$= \int_{0}^{t} \left[v \ln m_{0} - v \ln (m_{0} - Kt') - gt' \right] dt'$$

$$= \int_{0}^{t} \left[v \ln m_{0} - v \ln (m_{0} - Kt') - gt' \right] dt'$$

$$= \int_{0}^{t} \left[v \ln m_{0} - v \ln (m_{0} - Kt') - gt' \right] dt'$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} + m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

$$= \int_{0}^{t} \left[m \ln m - m - m_{0} \ln m_{0} \right]$$

Let
$$x = m_o - Kt'$$

$$dx = -K dt'$$

$$A = \frac{-1}{K} \int_{m_o}^{m} \ln x \, dx = \frac{-1}{K} (\times \ln x - x) \int_{m_o}^{m} \ln x \, dx = \frac{-1}{K} \left[m \ln m - m - m_o \ln m_o + m_o \right]$$
where $m = m_o - kt$.

$$y(t) = -\frac{1}{2}gt^{2} + v_{ex}(l_{n}m_{o})t$$

$$+ \frac{v_{ex}}{K} \left[m_{o}l_{n}m - Kt l_{n}m - m_{o}l_{n}m_{o} + Kt \right]$$

$$= (algebra) = -\frac{1}{2}gt^{2} + v_{ex}t - \frac{mv_{ex}}{K} l_{n}(\frac{m_{o}}{m})$$

The numerical calculation for Space Shuttle parameters

$$m_0 = 2 \times 10^6 \text{ kg}$$
; $K = 1 \times 10^6 \text{ kg/}(120 \text{ s})$; $v_{ex} = 3000 \text{ m/s}$;

then the height at time t = 120 s is

$$y(120 s) = 39.9 km.$$
